

A new equilibrated residual method: improving accuracy and efficiency of flux-free error estimates

Núria PARÉS and Pedro DÍEZ

Laboratori de Càlcul Numèric (LaCàN)
Universitat Politècnica de Catalunya (Barcelona)
<http://www-lacan.upc.edu>

Certification of FE approximations

The finite element method is a basic tool in engineering design and since engineering decisions are based on approximations of the solution, it is crucial to **certify the quality of the results**.

GOAL: provide a guaranteed interval for the value of the QoI

$$\ell^{\mathcal{O}}(u) = \int_{\Gamma} \sigma_{VM}(u) d\Gamma$$

$$\ell^{\mathcal{O}}(u) \in [L^-, L^+]$$

Certification of FE approximations

The finite element method is a basic tool in engineering design and since engineering decisions are based on approximations of the solution, it is crucial to **certify the quality of the results**.

GOAL: provide a guaranteed interval for the value of the QoI

$$l^{\circ}(u) = \int_{\Gamma} \sigma_{VM}(u) d\Gamma$$

HOW?

1. compute $l^{\circ}(u_h)$
2. define $l^{\circ}(e) = l^{\circ}(u) - l^{\circ}(u_h)$
3. **bound** $s^- \leq l^{\circ}(e) \leq s^+$

$$l^{\circ}(u) \in [l^{\circ}(u_h) + s^-, l^{\circ}(u_h) + s^+]$$

Certification of FE approximations

The finite element method is a basic tool in engineering design and since engineering decisions are based on approximations of the solution, it is crucial to **certify the quality of the results**.

GOAL: provide a guaranteed interval for the value of the QoI

$$l^{\circ}(u) = \int_{\Gamma} \sigma_{VM}(u) d\Gamma$$

HOW?

1. compute $l^{\circ}(u_h)$
2. define $l^{\circ}(e) = l^{\circ}(u) - l^{\circ}(u_h)$
3. **bound** $s^{-} \leq l^{\circ}(e) \leq s^{+}$

$$l^{\circ}(u) \in [l^{\circ}(u_h) + s^{-}, l^{\circ}(u_h) + s^{+}]$$

We need a posteriori **GUARANTEED/STRICT** error bounds.

Certification of FE approximations

The finite element method is a basic tool in engineering design and since engineering decisions are based on approximations of the solution, it is crucial to **certify the quality of the results**.

GOAL: provide a guaranteed interval for the value of the QoI

$$l^{\circ}(u) = \int_{\Gamma} \sigma_{VM}(u) d\Gamma$$

HOW?

1. compute $l^{\circ}(u_h)$
2. define $l^{\circ}(e) = l^{\circ}(u) - l^{\circ}(u_h)$
3. **bound** $s^- \leq l^{\circ}(e) \leq s^+$

$$l^{\circ}(u) \in [l^{\circ}(u_h) + s^-, l^{\circ}(u_h) + s^+]$$

We need a posteriori **GUARANTEED/STRICT** error bounds.
They also have to be **ACCURATE** and **CHEAP**

EXPLICIT Flux-free estimator

Model problem

Reaction-diffusion equation:
$$\begin{aligned} -\Delta u + \kappa^2 u &= f && \text{in } \Omega, \\ u &= u_D && \text{on } \Gamma_D, \\ \nabla u \cdot \mathbf{n} &= g_N && \text{on } \Gamma_N. \end{aligned}$$

Weak form: find $u \in \mathcal{U}$ such that

$$\underbrace{\int_{\Omega} (\nabla u \cdot \nabla v + \kappa^2 uv) \, d\Omega}_{a(u,v)} = \underbrace{\int_{\Omega} f v \, d\Omega + \int_{\Gamma_N} g_N v \, d\Gamma}_{\ell(v)} \quad \forall v \in \mathcal{V}.$$

Finite element approximation: find $u_h \in \mathcal{U}^h$ such that

$$a(u_h, v) = \ell(v) \quad \text{for all } v \in \mathcal{V}^h.$$

triangular mesh + linear elements

Error equations: find $e = u - u_h \in \mathcal{V}$ such that

$$a(e, v) = \ell(v) - a(u_h, v) = R(v) \quad \text{for all } v \in \mathcal{V}.$$

Guaranteed error bounds

The **complementary energy** approach allows to overestimate $\|e\|$
 approach introduced by Fraeijs de Veubeke in 1964

$$a(e, v) = \int_{\Omega} (\nabla e \cdot \nabla v + \kappa^2 e v) d\Omega = R(v) \quad \text{for all } v \in \mathcal{V}$$

$$\int_{\Omega} (\mathbf{q} \cdot \nabla v + \kappa^2 r v) d\Omega = R(v) \quad \text{for all } v \in \mathcal{V}$$

new error unknowns

Guaranteed error bounds

The **complementary energy** approach allows to overestimate $\|e\|$
 approach introduced by Fraeijs de Veubeke in 1964

$$a(e, v) = \int_{\Omega} (\nabla e \cdot \nabla v + \kappa^2 e v) d\Omega = R(v) \quad \text{for all } v \in \mathcal{V}$$

$$\int_{\Omega} (\mathbf{q} \cdot \nabla v + \kappa^2 r v) d\Omega = R(v) \quad \text{for all } v \in \mathcal{V}$$

new error unknowns

Dual formulation:

Any pair of dual estimates (\mathbf{q}, r) such that

$$\int_{\Omega} (\mathbf{q} \cdot \nabla v + \kappa^2 r v) d\Omega = R(v) \quad \text{for all } v \in \mathcal{V}$$

provide an upper bound for the energy norm of the error

$$\|e\|^2 = \int_{\Omega} (\nabla e \cdot \nabla e + \kappa^2 e^2) d\Omega \leq \int_{\Omega} (\mathbf{q} \cdot \mathbf{q} + \kappa^2 r^2) d\Omega$$

complementary energy

Guaranteed error bounds

Global problem: find \mathbf{q} and r

$$\text{s.t. } \int_{\Omega} (\mathbf{q} \cdot \nabla v + \kappa^2 r v) d\Omega = R(v)$$

TOO EXPENSIVE

minimizing the upper bound $\int_{\Omega} (\mathbf{q} \cdot \mathbf{q} + \kappa^2 r^2) d\Omega$

Guaranteed error bounds

Global problem: find \mathbf{q} and r

$$\text{s.t. } \int_{\Omega} (\mathbf{q} \cdot \nabla v + \kappa^2 r v) d\Omega = R(v)$$

TOO EXPENSIVE

minimizing the upper bound $\int_{\Omega} (\mathbf{q} \cdot \mathbf{q} + \kappa^2 r^2) d\Omega$

SPLIT THE GLOBAL PROBLEM INTO LOCAL PROBLEMS

Guaranteed error bounds

New guaranteed, accurate and cheap error estimate (EE)

Local problems: find q^i such that

$$\int_{\omega_i} q^i \cdot \nabla v d\Omega = R(\phi_i v) \quad \forall v \in \mathcal{V}(\omega_i)$$

minimizing the local complementary energy

$$\int_{\omega_i} q^i \cdot q^i d\Omega$$

KEY POINT

Find a closed EXPLICIT solution for q^i

New guaranteed, accurate and cheap EE

From star ω_i to elements $\Omega_k \subset \omega_i$

$$\int_{\omega_i} \mathbf{q}^i \cdot \nabla v d\Omega = R(\phi_i v)$$

New guaranteed, accurate and cheap EE

From star ω_i to elements $\Omega_k \subset \omega_i$

$$\int_{\omega_i} \mathbf{q}^i \cdot \nabla v d\Omega = R(\phi_i v)$$

The explicit solution is found introducing the linear tractions on the edges of the star $\{g_{\gamma[m]}^i\}$

New guaranteed, accurate and cheap EE

From star ω_i to elements $\Omega_k \subset \omega_i$

$$\int_{\omega_i} \mathbf{q}^i \cdot \nabla v d\Omega = R(\phi_i v)$$

The explicit solution is found introducing the linear tractions on the edges of the star $\{g_{\gamma[m]}^i\}$

New guaranteed, accurate and cheap EE

From star ω_i to elements $\Omega_k \subset \omega_i$

$$\int_{\omega_i} \mathbf{q}^i \cdot \nabla v d\Omega = R(\phi_i v)$$

The explicit solution is found introducing the linear tractions on the edges of the star $\{g_{\gamma[m]}^i\}$

for every $\Omega_k \subset \omega_i$

$$(\mathbf{q}_k^i + \phi_i \nabla u_h) \cdot \mathbf{n}_k^\gamma = \sigma_k^\gamma g_\gamma^i$$

Neumann BC

Divergence

$$-\nabla \cdot (\mathbf{q}_k^i + \phi_i \nabla u_h) = \phi_i (f - \kappa^2 u_h) - \nabla u_h \cdot \nabla \phi_i$$

New guaranteed, accurate and cheap EE

Strong form of the elementary problems:

$$-\nabla \cdot (\mathbf{q}_k^i + \phi_i \nabla u_h) = \phi_i (f - \kappa^2 u_h) - \nabla u_h \cdot \nabla \phi_i \quad \text{in } \Omega_k$$

$$\mathbf{q}_k^i \cdot \mathbf{n}_k^\gamma = \sigma_k^\gamma g_\gamma^i - \phi_i \nabla u_h \cdot \mathbf{n}_k^\gamma := \mathcal{R}_{|\gamma} \quad \text{on } \partial\Omega_k$$

New guaranteed, accurate and cheap EE

Strong form of the elementary problems:

$$-\nabla \cdot (\mathbf{q}_k^i + \phi_i \nabla u_h) = \phi_i (f - \kappa^2 u_h) - \nabla u_h \cdot \nabla \phi_i \quad \text{in } \Omega_k$$

$$\mathbf{q}_k^i \cdot \mathbf{n}_k^\gamma = \sigma_k^\gamma g_\gamma^i - \phi_i \nabla u_h \cdot \mathbf{n}_k^\gamma := \mathcal{R}_{i\gamma} \quad \text{on } \partial\Omega_k$$

Explicit solution: $\mathbf{q}_k^i = \mathbf{q}_k^{iL} + \mathbf{q}_k^{iC}$ as long as

$$\int_{\Omega_k} [\phi_i (f - \kappa^2 u_h) - \nabla u_h \cdot \nabla \phi_i] d\Omega + \sum_{\gamma \subset \partial\Omega_k} \int_\gamma \sigma_k^\gamma g_\gamma^i d\Gamma = 0,$$

$$\|e\|^2 \leq \sum_{k=1}^{n_{el}} \left(\underbrace{\|\mathbf{q}\|_{[\mathcal{L}^2(\Omega_k)]^3}}_{\text{dual error}} + \underbrace{\frac{h_k}{\pi} \|f - \Pi^1 f\|_{\mathcal{L}^2(\Omega_k)}}_{\text{data oscillation}} \right)^2$$

Conclusions

- We have developed a new technique to compute **guaranteed upper bounds** for the energy norm of the error (which can also be used to compute bounds for QoI)
- The proposed strategy may be seen as either:
 - (1) an **improved cheap version of the flux-free estimate**
 - (2) a new **more accurate hybrid-flux equilibrated EE**
- **Alleviating the cost of the flux-free approach does not introduce a significant difference on accuracy**
- The new equilibrated tractions yield **sharper bounds** than the original ones

A new equilibrated residual method: improving accuracy and efficiency of flux-free error estimates in two and three dimensions
